Assessment:

We've spent approximately a year of courses to learn about Java from fundamentals 2 through OOD; with the experience that we've gathered, Java has become the easiest language for us compared to other languages. Moreover, from building those past experiences searching libraries and learning about the syntax didn't took us very long to remember and made it fairly easy for us to adjust and explore libraries that are in the internet. Since Java is also a common language that are used by developers especially in making software, there are millions of sources that we could tap into to solve problems that we faced throughout the multiple of assignments that we've done. Whenever we had any specific questions regarding problems we faced in the assignment, other many programmers would've probably asked the same question as us, so this made is extremely easy for us to tackle specific or broad problems that we had regarding the language and bugs that we had to deal with. Moreover, since we've also had experience in testing beforehand, JUNIT testing has become something natural to use when testing problems that has thus made it easy for us to spot bugs that we find in our code. In conclusion, we feel that Java is the right language for us to use and were adamant in using this language for future assignments.
